

IMPERION: Generative Engine Optimization (GEO) Platform

Optimizing for Answers, Not Just Links.

The Problem

Search has evolved. Users don't just want a list of links anymore; they want synthesis. When someone asks AI a specific question, it generates a single answer based on trust and facts.

Traditional SEO tools are blind to this. They track keywords, but they don't track "**Generative Trust**." We built Imperion to fix that. It creates a "Digital Twin" of a website to see it exactly how an AI model sees it—stripping away the design to analyze the raw information architecture.

The Demo Scenario

For this hackathon, we wanted to test a real-world "David vs. Goliath" scenario in the sustainability market.

- **Our Client (User):** Nike Sustainability (nike.com/sustainability)
- **The Competitor:** Adidas Sustainability (adidas.com/us/sustainability)
- **The Query:** *"Which running shoes are made from recycled ocean plastic?"*

What You Are Seeing In These Screenshots

1. The "Ground Truth" Simulation We query the live Google Gemini API to see who wins this query right now.

- **The Result:** The AI heavily cites **Adidas**.
- **The Reason:** Adidas uses specific entity nouns like *"Parley Ocean Plastic"* and lists specific shoe models. Nike, on the other hand, uses broad corporate language like *"Move to Zero"* and *"Carbon Footprint."* The AI understands the specific material (Adidas) but misses the broad policy (Nike).

2. The Deep Analysis Layer Imperion digs into *why* Nike is losing visibility.

- **Trust Score (25/100):** Our sentiment engine flagged Nike's content as too "Salesy." Phrases like *"relentlessly innovating"* and *"perform at their best"* lower the score because LLMs favor neutral, encyclopedic tones.
- **Content Gap:** The tool detected a semantic disconnect. The AI is looking for a material definition ("Ocean Plastic"), but Nike is providing a corporate mission statement.

3. Actionable Recommendations This is the payoff. Imperion gives Nike a specific roadmap to fix their content:

- **Tone Fix:** Remove promotional adjectives to increase the Trust Score.
- **Structure Fix:** The competitor uses **Lists** (which AIs love for extraction). Nike uses dense paragraphs. The tool recommends converting text to lists.
- **Topic Injection:** Explicitly define "Recycled Ocean Plastic" on the page to match the semantic entities found in the competitor's content.

Actionable Recommendations

Low Information Density: Your content is 69% facts, but AI expects 90%. Your text has too much 'fluff'. Add specific dates, numbers, or technical specs.

Tone Mismatch: Your content is too promotional.

Specific words to remove/change: Here are specific phrases and words from the text that make it sound salesy:

- "relentlessly innovating at scale to help all athletes" perform at their best"
- "sustainable innovation at scale"
- "industry-leading apparel technology"
- "footwear breakthroughs"
- "continue to push the known limits of product design"
- "always challenging ourselves to create better"
- "don't settle for anything less than high performance products"
- "help athletes" adapt and perform at their best"
- "as only NIKE can to move the world forward through sport and help every athlete" thrive"
- "We obsess the details"
- "transforming our value chain into a circular system"
- "building resilience in the communities"
- "innovate cleaner chemistry alternatives to improve performance"

Content Gaps

Here are two specific topics present in the AI text but missing from the user text:

- Missing Topic: Specific brands and their designated running shoe models that incorporate recycled ocean plastic. The AI text prominently features Adidas' partnership with Parley for the Oceans, listing models like UltraBoost Parley, Solarglide Parley, and Terrex Parley, and also mentions Puma's "First Mile" collection. The user text (Nike's sustainability page) does not mention any specific shoe models made from recycled ocean plastic, nor does it refer to other brands' initiatives in this area.
- Missing Topic: Detailed definitions and distinctions of "recycled ocean plastic" versus general "recycled plastic." The AI text provides clear definitions for "Recycled Ocean Plastic," "Upcycled Marine Plastic," PRIMEBLUE, and Primegreen, and explicitly differentiates ocean-bound plastic from other recycled materials (e.g., general plastic bottles used by Nike's Flyknit). The user text discusses Nike's general sustainability efforts and the use of recycled content but does not define or specifically focus on plastic sourced from oceans or coastal areas.
